

Secure emailing, the easy way

Reports from the UK Data Protection Authority (DPA) reveal that most data breaches occur when sharing data with others. Almost half of all data breaches (47%) reported in 2017 concern personal data sent to the wrong recipient. How can you protect your organisation against this?

ZIVVER is a user-friendly solution for secure emailing straight from your familiar email programme. This enables you to prevent human errors, encrypt your data against hackers and keep control of the sent information.

ZIVVER in a nutshell:

1 Preventing human errors

ZIVVER notifies or alerts you in real-time before you send an email containing sensitive information. Smart business rules specific to your industry are the starting point for sensitive information identification. In addition, ZIVVER identifies 'conspicuous recipients' who have not received this type of sensitive information before. By showing the alert on screen immediately, ZIVVER contributes to the information security awareness within your organisation. This is also an important GDPR requirement.

Users always keep control through the ability to revoke sent emails at any time. This way, you stop (potential) data breaches.

2 Securing information

Only the sender and the intended recipient(s) gain access to a message. Automatic TLS secure connections, zero-knowledge encryption and additional authentication keep hackers and unauthorized people out.

Two-factor authentication (2FA) is standard on all ZIVVER accounts and optional when sending a message. The sender can choose if and what kind of authorisation he applies. The recipient will receive a code by text message to open the secured message. Mobile number unknown? Use an access code!

47% of all data breaches concern personal data sent to the wrong recipient.

3 Easy for users

ZIVVER allows you to work safely from your familiar environment (such as Outlook), any mail server (such as Gmail) or your browser, which is convenient for Apple products.

From your own trusted email solution you can transfer files up to 5TB. You no longer need to depend on free and unsafe file transfer services. ZIVVER is available both on desktops and mobile devices, making it perfect to use at work, at home and on the go. For secure emailing on mobile phones and tablets, download the app.

Besides personal accounts, you can create functional accounts. These accounts can be used by different employees within a particular department, such as contact@organisation.com. Employees will gain access to a functional account with their personal account.

4 Convenient for guest users

Anyone can receive, reply to, copy and download secure email messages, even without a personal account. A notification is provided via email, directing the recipient to the secure guest environment. To increase the recognisability and reliability of these messages, add your company logo and corporate branding.

5 Starting with ZIVVER is easy

All it takes is a one-off, limited time investment of your IT department, and then your employees will work with a simple single sign-on solution. This way your employees are immediately logged into ZIVVER when they log in at their workstation. ZIVVER connects with the user experience of your email solutions. Outlook only shows an extra ZIVVER bar at the top.

6 Complying with laws and regulations

ZIVVER complies with ISO 27001 and is your future-proof solution to prevent data breaches. ZIVVER's proactive notifications and alerts create awareness amongst your employees about privacy-sensitive information.

Suspect a data breach? ZIVVER offers an extensive audit log and a communication log per user. This enables you to act quickly, limit damage of reputation and comply with the obligation to notify data breaches.
